ENDAVO | PLATFORM UPDATE

EMMS Release Notes

October 23, 2026

This release enhances media processing and administration, improves live restream tracking, and refines the EMMS dashboard search experience for administrators using mobile devices.

New Features & Enhancements

Encoding Reports: Updated Interface

Encoding reports in the Endavo Media Management System (EMMS) have been migrated to React, providing a modernized interface for reviewing encoding activity.

Faster Availability of Newly Activated Videos

Newly uploaded and activated media can now be viewed immediately on customer websites and apps when the source video is a compliant H.264-encoded MP4 file with a bitrate below 5 Mbps. This helps shorten the time between activation and viewer access for eligible files.

Bulk Deletion of Unactivated Uploads

Administrators can now select multiple uploaded files in an EMMS account's upload folder and delete them in a single action, making it easier to clean up files that have not yet been activated.

Unique Identifiers for Live Restreams

Endavo now includes a unique identifier for restreams in calls to the Wowza API, supporting more precise identification and management of restream activity. Restream management improvements are expected in future release(s).

Improved Mobile Search in the EMMS Dashboard

The Search interface in the Endavo Media Management System (EMMS) dashboard has been improved to make searching easier and more usable on mobile devices.
