

Endavo Media Management System (EMMS) – Release Notes

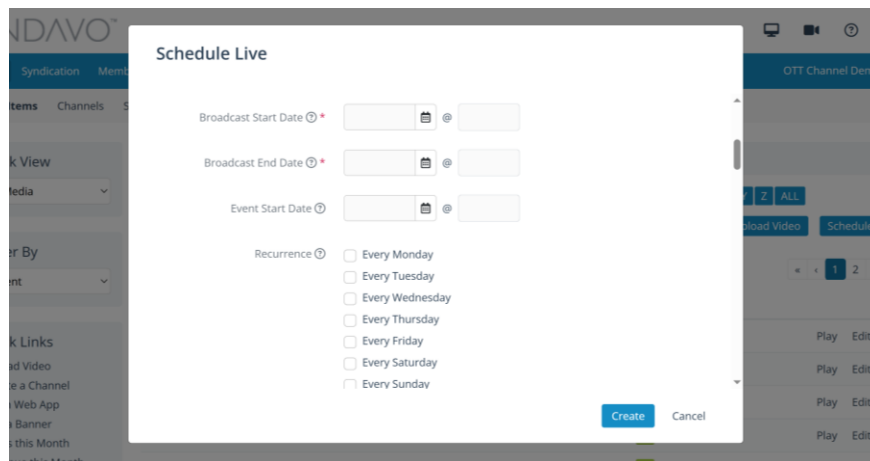

Release Date: October 14, 2025

This release delivers a major upgrade to live and virtual live event management, performance enhancements across key pages, and improvements to user experience and marketing workflows.

New & Updated Features

React Migration for Live Management: Creating, scheduling, and editing Live Events (LE), Virtual Live Events (VLE), Live Channels (LC), and Virtual Live Channels (VLC) are now built on React, offering a faster, modernized, and more responsive user experience.

Weekly Recurrence Options for Events: For recurring Live and Virtual Live Events, new options are available to select individual or multiple days of the week for recurrence (e.g., 'Every Monday', 'Every Tuesday', etc.).

Switch Between Live and Virtual Events: Users can now easily switch a Live Event to a Virtual Live Event and vice versa, providing flexibility in event management and setup.

Original Event Data in Media View: For recorded LEs and VLEs that transition to a VOD recording, a new section in the Media View page displays Original Event Data, including a link to the Schedule. (Note: this feature has not been thoroughly tested.)

Media Page Speed Optimization: Significant system performance improvements have been made to the Media List page, especially improving accounts with large content libraries.

New 'Thank You' Route for Get Started Page: A new 'thank-you' route has been added for the Get Started page used by new trial accounts, allowing marketing teams to better track and attribute new leads.

If you have any questions about these updates or would like assistance using the new features, please contact our support team.
