

Endavo Media Management System (EMMS) – Release Notes

Release Date: March 23, 2026

This release introduces enhancements to XML batch uploads, streamlines rental bundle management, and improves Virtual Live Event and Channel scheduling functionality.

New & Updated Features

Enhanced XML Batch Upload Support: Two issues related to XML Batch Upload processing have been resolved. In addition, several new fields have been added to support more detailed activation forms for batch-uploaded media items. XML batch uploads continue to work alongside FTP-based video file uploads for streamlined content ingestion workflows.

Simplified Rental Bundle Management: Rental Bundles have been moved into the Plans section and now include pricing, access rules, and bundled videos within a single workflow. This enhancement eliminates the need to separately create a Rental Plan and associate it with a standalone Rental Bundle previously managed under the Media tab.

Virtual Live Event & Channel Scheduler Improvements: A scheduling issue affecting events that continue from one day into the next has been resolved, preventing output stream problems. Additionally, when adding or adjusting media in schedules, users can now define timing with seconds in addition to hours and minutes for more precise scheduling control.

If you have any questions about these updates or would like assistance using the new features, please contact our support team.
