

## Endavo Media Management System (EMMS) – Release Notes

Release Date: May 7, 2026

This release introduces enhanced live event automation workflows for App Builder video lists, performance optimizations for Endavo-generated websites, and additional stability improvements across the platform.

### New & Updated Features

**Live Event Status Filters for App Builder Video Lists:** A new Live Events Status filter has been added for creating video lists within App Builder. Users can now automatically organize live events based on status categories such as Upcoming, Live Now, and Past. This enables automated workflows that add or remove live events from video lists before, during, and after streaming, while also supporting customized live event collections for viewers. The enhancement improves both operational efficiency and the viewer experience.

**Website Framework Performance Optimizations:** Performance improvements have been implemented for Endavo-generated websites and web app frameworks, resulting in faster page responsiveness and a smoother browsing experience for viewers.

**Minor Fixes & Enhancements:** Additional minor bug fixes and platform enhancements have been implemented to improve reliability, stability, and overall system performance.

If you have any questions about these updates or would like assistance using the new features, please contact our support team.
