

Endavo Media Management System (EMMS) – Release Notes

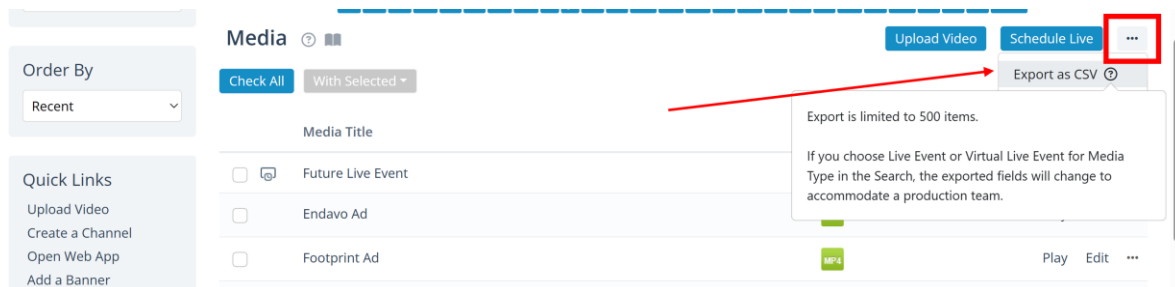

Release Date: August 11, 2026

This release introduces new CSV export capabilities for media and live production workflows, along with improved notification and recovery tools for subtitle files submitted through FTP batch uploads.

New & Updated Features

Media Inventory Export to CSV

Users can now export their media inventory directly from EMMS as a CSV file, with exports supporting up to 500 media items. The export also adapts automatically to the media list being viewed. When search filters are used to display Live Events (LE) or Virtual Live Events (VLE), the CSV fields change to provide production-oriented information, including event details and streaming server settings such as stream servers and stream keys. This makes it easier for production teams to access and manage the technical information needed for live event operations.

FTP Batch Upload Subtitle Error Notifications

Clients will now receive an email notification if an issue occurs with subtitle files submitted as part of an FTP batch upload. After receiving the notification, users can correct the affected subtitle file and manually upload it directly within the media item form in EMMS, providing a clearer and more efficient recovery workflow.

If you have any questions about these updates or would like assistance using the new features, please contact our support team.
